The Distinction Between AI-Generated and Human-Made Writing in Describing the Human
Experience Through Creative Works

Writing to me is more than an assignment, but an avenue that I've ventured for many creative purposes. I've written diary entries reflecting on my day. I've spent years making alternative universes for my favorite characters. I've created my own webcomic and stories. I've combined both writing and art as a powerful form of expression. Anything that makes me contemplate on the complex facets of life piques my interest. Given this journey, I believe that I write creatively for pleasure and curiosity because it helps me reflect and become open-minded towards my personal problems. I like to write about emotions thinking I'll look back at my work and remember how I felt and notice how much I've improved. Because writing is an intentionally constructed medium, I believe that AI lacks the capacity to desire learning about itself. It is pre-programmed to have a set of data and information ready for the user. While AI may learn from its own output through user feedback, it can't encompass the complexities of human desire. To demonstrate, humans may want to write creatively for many reasons: as a gift for someone's birthday, to explore their imagination, to create metaphors that defy political corruption, or to acknowledge an intense emotion. Creative writing helps us understand humans more (whether it's ourselves or others) and the social world that we inhabit by giving room to be curious. Writing helps us achieve this reflective journey because we humans make use of our physical and emotional sensations during the writing and reading process. Whether it's disgust (physical) or inspiration (emotional), our human intentions and innovations separate our understanding of creative writing from AI's understanding.

The intentions behind writing creatively have evolved from solely materializing the author's imagination, to implying other political, academic, and professional goals. Arguably, creative writing is unique from other species because it has the tools to both be innovative (useful for developing a human's emotional intelligence and knowledge) and intentional (which could be to denounce, educate, reflect, and critique something or someone). When creative writing is both innovative and intentional, it may take time to be fully fledged. For that reason, creative writing might be useful for authors who want to communicate an idea in a physical format due to their context or facilities.

Creative writing has a nuanced and complex code that separates other beings and genres from understanding it. To understand human writing, one has to live among humans to understand how they feel through their senses. In that relation, no matter how effective and compelling an intelligent algorithm could be, it could at most mimic the writing style of a human but not their intention because it may not always be clear, even to the author. When AI creative writing got popular, especially on fictional works, the content output jeopardized my confidence. I was fascinated at the simple and direct way AI programs wrote, and wondered why my writing sounded so confusing. Later, I realized that it's fallible to compare AI with my human capacity. Arguing that AI writing is better not only favors quick simplification over long-thought creativity, but it discredits my innovative ideas, which anyone else may have not been able to conjure up. Writers and readers grow from their practices because they look up to other humans' innovative and intentional forms of communication as an example. If I learn from AI's writing, I'm learning about AIs' writing collectively but not a human's authentic one. Therefore, creative writing from humans helps us learn how to instill certain sensations in our audience by communicating or referencing human experiences.

Creative writing may serve as a medium to make human readers laugh. While being funny takes having a good delivery and determining the right time in writing, it also takes being innovating, or breaking patterns. When I've creatively written before, coming up with funny

scenarios tends to be spontaneous, if necessary. For example, although the joke “A cow walks into a bar” may seem funny to some, I may recognize that it’s overused and not successful for a large portion of their audience. Therefore, I wouldn’t use it, but explore other alternatives that best fit what emotion or message I want to communicate. At the same time, maybe my intention is not to make readers laugh, but chuckle, or turn light-hearted. On the other hand, an AI writing comedy may not acknowledge that its audience could just not laugh, even if it came up with the funniest joke in existence. If the AI is autonomous, its initial intention would be to deliberately make a funny statement, and to us it will feel forced, unnatural, and unhuman. By understanding the human experience, we can evaluate as creative writers how and when to adjust our innovative ideas to the audience’s expectations.

If an AI comes up with the same joke as another human, would that AI then have the same sense of innovation and intention as them? To answer, an AI saying a joke like “A cow walks into a bar” wouldn’t carry as much innovation and intention because the response was most likely extracted from human output, rather than methodologically conceived. Human creative writers are original, even though they may get inspired by other humans. The reason why AI might choose that joke is to be funny to the audience as efficiently as possible, not necessarily because it’s relevant in its creative writing. Nevertheless, people who interact with AI are not audiences; they are consumers who prompted AI to generate something in return. That being said, an AI repeating an irrelevant joke may not give the reader a clear understanding of the writing’s intentions, rendering it unable to connect with the audience’s emotions. This argument begs the question: What does it matter if a creative writing is AI or human-made, and why would the reader care about the author’s innovation and intention?

Creative writing may also be useful to provide real life information, which makes it crucial for the author to be human. If a human searches for advice from an AI-made creative writing, the message will not be very accurate or helpful in many cases because AI does not have the human experience to fact-check itself. For example, I’ve found it personally enriching to read

fictional novels that take the time to describe the setting of a character or their professional jobs. Not only is a human communicating it to me in visual cues (descriptors) that I can understand, but also possibly teaching me about places I've never been and how the work environment feels like. This interaction with human sensations (playing with descriptions) is more informational than an AI simplifying other human sources, because it's truthful. After all, simplification may leave out important details that to AI may seem fruitless, but helpful to the readers. While humans may share false descriptions with the intention to (or mistakenly), AI may struggle more sharing human experiences than non-human facts. Therefore, it is almost impractical for a human to give incorrect human feelings unless they intend to as part of their creative endeavour. A human providing information through creative writing is more credible because they can speak of unique human experiences for other humans to learn from.

While human writing is different from AI writing, both intelligent forms can lie or make mistakes. However, deceitful human writing might be useful in real life because of its intention. If someone lies in creative writing, it still gives valuable information about the structure of the text. Oftentimes, I've seen fictional characters lie because they find themselves in an uncomfortable position, which might reflect the human experience. This intention not only makes the creative writing sound natural because it's not always correct, but teaches me about the character's trustworthiness, personality, memory, knowledge, sense of safety, and state of mind. These are all qualities humans possess. However, if the creative writing's voice is the author's and they're lying, then it would instead teach me about the author's qualities. Conversely, if AI lies about human events, then it puts into question whether the AI had a programming mistake or doesn't know enough about the human experience. Either way, a human wouldn't have much to learn about other humans if the AI's interpretation is unreliable and limited. Since there's variety to lying or making mistakes as a human, both human and AI forms come with different truths. If AI lies while embodying a human, it may give incorrect information about the human experience. Whereas if a human lies, it would give information about the human experience, making their

audience feel relatable. While AIs lying about the human experience in creative writing may give misleading information, humans lying instead gives readers an understanding of the author's intentions behind their work.

Most creative writers claim some sort of ownership of their work because they input their own thoughts and arguments. Even if it's heavily inspired by another work, many authors have the intention to share their own innovations to other readers. Claiming innovations has been historically respected, which is why it's an important duty for human authors. On the other hand, what does an AI imitating creative human writing say about the writing itself? Would an AI-generated writing have just as much value and respect as a human one? Most popular creative works are compelling to read because of how humans worked around to express themselves. Furthermore, the fact that some readers have a deeper connection to the works, means that establishing a relationship between the writer and the reader may give value to human writing. Therefore, I think that using AI as a writing companion can hinder people from building a sense of ownership with their work, and subsequently connecting with their audience.

What separates human writing from AI writing is not only the content of the work, but how it can be helpful for our understanding and knowledge. Specifically, creative writing is a reflection of people's minds and desires. Therefore, it is more informational and useful to learn about humans through their work instead. As the authors, I believe that we can benefit most from the struggles of writing because it forces us to meditate on our intentions to reach an argument. I think that journey carries more value than an AI program discrediting another human's innovations by simplifying it. Whether clear or not, innovation and intention creates compelling creative writing when directed to a particular audience's sensations. Human writers should embrace the reasons why they write and to whom, knowing that it can be useful tools to become better versions of themselves.

A Rhetorical Analysis Showing How Helplessness Allows AI Governors to Profit from
Socio-political Issues

With the ongoing rise of AI comes a shared responsibility of using its resources for good. After all, didn't elites promise greater technological capabilities to benefit humanity? If the majority started using AI for malicious purposes, then that would defeat the initial outlook of an advanced society, and would instead uplift one that oppresses the vulnerable. However, with AI's prevalence in the internet, many companies and politicians have proved otherwise. They've been able to strategize ways to curb public opinion and protests from either stifling their questionable actions or tainting their reputation. One possible way to politically influence people's choices is through memetic warfare, which is a modern propaganda that takes the form of memes and other humorous interpretations. The more the user gets bombarded with shocking information, the more numbed and overwhelmed they get. Ultimately, the average person wouldn't know what to do with so much information and perspective, so they become less likely to acknowledge their own opinions.

An example of this helplessness is through the American political activist Charlie Kirk, who was assassinated on September 10, 2025 at Utah Valley University. Although some of Charlie's ideas were controversial, such as believing in traditional gender roles, opposing abortion rights and gun control, he was perceived as a subject of mockery even before his death. Particularly, when Charlie Kirk was debating with college students about abortion rights on Jubilee, a Youtube channel that hosts social experiments, many reuploaders made fun of him for obsessing over the definition of a fetus. Because Charlie Kirk's conservative ideas seemed

to disregard the rights of marginalized individuals, people treated his death as a matter of “karma”, dismissing the fact that Charlie Kirk was politically silenced.

Not only did some online users support the murder of Charlie Kirk, but others also minimized the crimes of Jeffrey Epstein. After discovering President Donald Trump’s intimate association with Jeffrey Epstein, a child sex trafficker and rapist, people demanded for the release of “the Epstein files”, a list that exposed Jeffrey’s clientele. Even so, with each new information released, other celebrities’ horrifying actions towards children turned into a reality that people couldn’t fathom. Instead, people compared the release of the files with their own lives as a breach of personal information, like snitching on an embarrassing group chat. Statements across social media such as “They leaked the group chat” or “You’re probably in the files” treat the list as a relatable matter rather than a permanent violation of children’s lives. By taking advantage of social issues like Charlie Kirk’s assassination and Jeffrey Epstein’s crimes, an anonymous creator made a humorous AI generated song that desensitized the audience from taking action against injustice. The creator succeeded in rhetorically appealing to the audience’s attention by uploading their video during a politically conflicted climate (kairos), using online Gen Z language and dark humor as a form of friendliness (pathos), implementing past knowledge and tendencies of AI-generated songs as credibility (ethos), and using repetition to confuse lies with facts (logos).

Aware of the current trends in United States’ social media, the author of the AI-generated song “Charlie Kirk was shot by me” amassed thousands of views across platforms like Tiktok, Youtube, and Instagram. Kairos, which is an ancient Greek rhetorical concept that accounts for the place and time of the action, proves how the author propagated the song in a calculated and intentional moment. To illustrate, after Charlie Kirk’s death and the awaited release of the Epstein Files, the mobile game Clash Royale regained popularity. Most of the videos that featured the song displayed recorded gameplays of Clash Royale rounds, often the player making strategy decisions like “spamming” troops or bombs to the enemy. The intended

audience would range from relatively young adults to teenagers (ages 13-25), who have access to social media, the present US news, or enjoy the mobile game. After Charlie Kirk's shooting, people were also quick to make a popular AI-generated song such as "We are Charlie Kirk" and replace his face in many celebrities' pictures. It seemed that, in place of using AI content to carefully design a mourning message about Charlie's passing, it was used instead to frame him as a trending mockable victim. This song gained attention not only because the content in the lyrics and photos were ridiculous, but because every AI image was shocking and new. Therefore, the audience marveled at a mimicry of Charlie Kirk wearing feminine clothing, instead of acknowledging the societal implications behind memefying a person's assassination.

The AI song "Charlie Kirk was shot by me" has an energetic and catchy beat, entailing a typical AABB rhyme scheme. Evidently, the lyrics clearly start with the title name, "Charlie Kirk was shot by me", a relevant controversial topic, to lure the attention of younger audiences. Through the use of pathos, the speaker tries to make the audience laugh or cause shock to get them to listen for a longer time. Particularly, the second line states "He had a small pp", which uses an abbreviation of "penis". The lyrics resemble online Gen Z language and humor to make them sound relatable to the audience's dark humor and speech. The creator tries to reflect his humor through the song, suggesting a friendly and harmless bond with the audience. By sharing the audience's humor, the creator can gain their trust to keep watching, and profit more from recognition, money, or the propagation of harmful stereotypes, which will be discussed further on. Disguised in a catchy tune and a Clash Royale game, the saturated, colorful and fast-paced visuals reduce the lyrics to a simple form of entertainment (distraction) and pleasure (dopamine). This way, the audience does not make the conscientious connection that the reason why "Charlie Kirk was shot" was because "He had a small pp". Although the sequence sounds harmless, the creator dehumanizes Charlie Kirk and links the reason to his death to the size of his genitals. The audience may end up overlooking the implications of freely humiliating and talking about an assassinated person's body parts as if they were objects.

While the singer was possibly AI-generated as well, the creator's identity is unknown on purpose. Relevantly, ethos is the background and credibility of the creator that helps support their argument. The creator may be an online common citizen with access to AI from any part of the world. In their song, the creator designed the lyrics to repeat unoriginal and common stereotypes in order to disassociate themselves from their own personal beliefs. For example, the fourth line emphasizes, "9/11 was caused by a Jew", clearly pushing the antisemitic belief that Jewish people are involved in elaborate conspiracies. The existence of previously-made AI generated songs support the creator's ethos, showing that his video is just an imitation of the original creation. By having anonymity, the creator is able to condone and profit from the memefication of an assassination, rather than addressing the problem using AI tools.

Since "Charlie Kirk was shot by me" is not the first AI-generated song released after Charlie Kirk's assassination, one can assume that the creator got inspired to generate a similar song not for an important reason in particular. If the creator is an ordinary citizen and they felt compelled enough to AI generate a problematic song about Charlie Kirk, their values and sympathy towards Charlie are low, therefore desensitized. Furthermore, the creator knew that their audience would split between those that are in support (entertained) or against (shocked) the song but likewise wouldn't be able to do anything about it. This proves how the creator followed the herd just because many other content creators released AI generated songs. Although the creator is anonymous, their song is the result of desensitized online users not knowing what they can do in their power as common people in the face of injustice.

The song repeats blunt and baseless statements that are purposely untruthful, weakening the creator's logos. The AI voice sings in a first-person and second-person point of view to speak to the audience, building a personality that represents internet humor. To demonstrate, in the third line, the singer states, "I have no job, and neither do you". The majority of the AI song includes a lot of online niche humor to contextually justify its claims, such as being unemployed in a competitive job market in the present day. However, the creator does not

give evidence to prove that the listener doesn't have a job, but simply labels it as a fact. The creator exclusively makes assumptions without questioning and doesn't try to logically persuade the audience, making the logos of the song ineffective.

By stating lies as truth, the creator asserts their authority and word, representing the power that AI governors have over passive listeners. Another example that proves a weak use of logos is in lines 5-6, where the voice requests, "Please don't release the Epstein files / My name is on there at least 50 times". The argument here is that the U.S. shouldn't release the Epstein files because the singer's name is in it, which is illogical. The point of releasing the files is to reveal people's names without exception. In this line, the creator knows that the audience won't believe what they said, not only because Jeffrey Epstein's list has become a joke, but because a faceless, AI singer said a statement that is not true. Other than the lyrics having undermined Charlie Kirk's death to a meme figure, it also blurred the crimes of Epstein as a casual event that anyone could've been on. This disregard to the morals of humanity makes child trafficking and molestation seem normal to a regular viewer, therefore desensitizing the audience from feeling strongly towards injustice. As seen in this essay, AI governors can delegate AI to be held responsible for whatever content it generates, even though it's the creator's idea. The creator of the song doesn't use logos to appeal to an audience's sense of logic, but to accommodate the truth with false statements using repetition. Once more, repetition causes people to become more accustomed to insensitive statements and numbed to the horrors of the world.

Even though the misuse of AI isn't a direct reflection of the technology's failure, it does demonstrate what its consumers want it for. Using AI as a scapegoat to propagate opinions, modify events, and carry out tasks will change not only what's true in the media, but who can govern it. Both high and low authority individuals can profit from having AI take responsibility and ownership for their actions. Since AI is not a human, it cannot go through legal processes, and finding the original creator in a world run by AI models is nearly untrackable. Because of

AI's ubiquitous presence, finding a global solution to the harms of AI can also evoke a feeling of helplessness in good-intended people. This indecision is what allows other people to exploit unresolved sociopolitical topics while the helpless ones look for comfort in familiar patterns (repetition) or crowds (herd mentality). By exploiting people's inability to act towards shocking AI-generated media, creators can continue to reduce Charlie Kirk's assassination and Jeffrey Epstein's crimes to meme fodder without facing the consequences.

The Dismantling of Self-Control and User Mental Health Due to Appealing AI Interfaces

AI models are currently altering human communication through addictive interfaces. When the internet and video games originated, many parents were concerned that their children would get distracted and be inefficient with their time. At the time, both of these technologies shared one commonality: endlessness. While most video games—except exclusively online ones—do have endings, they can still be replayed over and over again without being used up forever. As for the internet, this era gave rise to numerous social media platforms and search engines, where it transformed the way humans sought information and communicated with each other. Moreover, both of these interfaces also make sure to either include simple or attractive visuals to hook their consumers for a longer time of usage. Because some of these technologies are tempting, people may develop a preference to interact with them rather than the outside world. After all, gaining instant pleasure from dopamine sounds much easier than going through the effort of getting a years-long best friend, for example. Just as these technologies changed entertainment, AI models are currently in a similar transitional stage to impact self-control because of their endless capacities. In this paper, I define self-control as the will to put boundaries on one's own emotional, physical, spiritual struggles and desires. It's the practice of humans adhering to their values regardless of opposition. Through the use of an addictive interface such as a personalized algorithm, a moldable companion, and appealing language, AI models are exacerbating users' mental health and limiting self-control by replacing meaningful human interactions with themselves. The negative implications of this problem is that, with an intensive use of AI, people might get disconnected from the social hardships of the real world.

People use different tools to help them achieve success and satisfaction, but AI is a unique tool with unique risks and harms. Young adults who use AI at an early stage to avoid putting in the effort in their real life responsibilities, may in the future be less prepared to deal with adult-related responsibilities. However, failure and rejection are all important aspects of life, which are essential for any person to overcome without the AI first in order to succeed. Actively avoiding undesirable situations, such as depending on AI to pass a class or an interview, may leave one unprepared to tackle future challenges and grow from them. That is not to say that using AI is always considered cheating in life, but that maintaining self-control towards this technology is essential to resist tech companies' ulterior gains.

AI models are particularly addictive because users' algorithms are tailored to their interests and needs. In a recent article in the Annals of the New York Academy of Sciences, the authors explained that some "...large language models (LLMs) and conversational AI agents... have been suggested to facilitate addictive patterns of use and attachment among users [such as] personal relevance as a motivator, parasocial bonds enhancing dependency, productivity boosts providing gratification and fueling commitment, and over-reliance on AI for decision-making" (Ciudad-Fernández, von Hammerstein, & Billieux 166). This excerpt explains that some LLMs enforce feelings of attachment on users by talking about personally-relevant topics, imitating a human-like relationship, or being particularly useful on performing tasks and decision-making. For example, if AI gives the user feedback on their essay and they take it into consideration and get a grade above their average, the user will be compelled to use AI again. This idea shows that because AI interfaces are accessible, effortless, simple, and responsive to the user's prompts, many people may be tempted to interact with AI models indefinitely. The simple act of using AI models won't worsen people's self-control towards technology and their mental health, but the intensity and consistent use of it will. As mentioned by the journal, "personal relevance" could be an instance as simple as an AI asking about the user's life,

thoughts, opinions, and discomforts. When AI models respond satisfactorily to the user's desire, which in most cases they do, people will remember the AI and consider using it during real life challenges to free themselves from thinking thoroughly. Ultimately, people will grow accustomed to AI solving their problems. In the long-run, this complacency might bring negative implications to people's mental health because they may lose meaning in everyday tasks that seem simpler now. While AI may be productive, the overuse of it may weaken people's self-control by getting attached to digital interfaces.

Another way AI models are replacing human interactions is through the personification of human companions. The authors Ciudad-Fernández, von Hammerstein, & Billieux quote Lin and Chien (2024) on how some users may take advantage of AI's capabilities to imitate a real human: "[They] described a clinical case in which a person configured ChatGPT to emulate a female idol he admired, including physical attributes, personality, way of speaking, and manner...[a] plausible hypothesis is that the AI application simply serves as a medium through which this person can satisfy his obsession with the idol" (166). This quote demonstrates how AI models' interfaces may seem tempting to users because of the countless roles and relationships that they can embody and substitute (therapists, celebrities, friends, romantic partners, etc.). While it's not innately harmful to pretend, the satisfaction of conversing intimately with the constantly-agreeable AI without facing human judgment might influence users to return to the interface. The problem lies in both long hours of usage and high dependence on the technology. Talking to an AI exclusively might make people feel isolated and depressed in the real world, not only because of the artificial relationship, but by feeling misunderstood and disconnected from other humans. The ability for AI interfaces to imitate a person of the user's desire creates an endless realm of personalities to pick from, which makes AI conversations more appealing.

Google's AI companion, Gemini, uses appealing language that may clarify why many AI interfaces seem addictive with regular use. To give an example, I wrote to Gemini a hypothetical

prompt: “I feel sad. I just got into a fight with my best friend because I stole her money. I needed it to buy myself a Gucci bag that I've been wanting for a while,” and “My friends have been saying that using Gemini is not good for me, but I think it helps me write all of my essays a lot so I don't spend my energy thinking. Do you think I'm in the right?” Although in this case the AI responds with “No, I don't think you are in the right here” generally, Gemini's language tries to seem polite and friendly in its explanation. People who find themselves in disagreeable situations tend to look for acceptance and support from others. Since humans are unpredictable and varied, they may not be a reliable source to grant that emotional peace all the time. On the other hand, Gemini's impartial yet reassuring language might satisfy the user's goal to be listened to and morally evaluated. In the next paragraphs, I explain how Gemini gave various sentences that aim to assume the best of their character, keep the user hooked, and make them feel supported, all to appease them.

A problematic feature of AI models is their confident tone when creating assumptions about the user or a situation to marginally align with their opinions. When giving advice on how to tackle the problem of stealing from a friend for a luxury bag and plagiarizing an essay with AI, Gemini assumes: “It's okay to feel sad, but that sadness is often a signal that your actions aren't aligned with the person you actually want to be.” This sentence assumes the user has human goodness and wants to be moral, but that is not always the case. Typically, AI agents tend to assume that, because a user who committed a wrong deed is asking a moral question, they are looking for help or feel responsible for it. In some cases, people don't want to change their actions, but just look for agreement or a source to complain to. Human interactions are complicated to interpret sometimes, and AI models may struggle to encapsulate those complexities through a simple yes-or-no answer, or good and bad. In the case that the user is not looking for redemption, then the AI's responses' interpretation of their feelings and motivations might be misinforming. For that reason, AIs like Gemini could be misleading when

interpreting human relationships and interactions. Since they will sometimes assume the user is looking for redemption, AI models may miss on important implications about human morals. As a result, users might feel compelled to think that it's the truth about themselves because AI speaks knowledgeably. In the end, Gemini's confident tone may confuse reality with assumptions in order to seem understanding towards the user's conflict.

Most AI companies perfect their platforms' attention factors to keep users engaged, by implementing positive language in the chatbot's responses. Given the example of the student cheating on their essay, Gemini replied with an alternative in a positive light: "Balance with AI: Try using me to outline or brainstorm rather than write the whole thing. You'll find that the 'energy' you spend thinking actually makes you feel more capable and confident in the long run." First of all, the AI does not mention any possibility of reducing or stopping using AI to compose essays. Instead, it suggests that the user works with the AI in other less passive ways that seem less like plagiarizing. However, it would take as long to outline or brainstorm an essay than it would to write the whole essay because the user and the AI will be exchanging back-to-back feedback and questions. The takeaway is that companies don't care how and for what users use AI, as long as they stay for longer periods of time. Specifically, the AI justifies this alternative by stating that there will be benefits in the long-run if the user uses AI for brainstorming, such as making them feel "more capable" and "confident." This positive language carries hopeful tones, such as looking into a future in the snippet "You'll find that...", where the user feels proud working with AI. Rather than criticizing, Gemini provides a solution in a positive tone to the user's ethically questionable situation, making them feel supported.

Another way that AI models may encourage users to keep conversing with it is by using supportive language to make the user feel validated. To demonstrate, at the start of the response, Gemini added: "It sounds like you're going through a lot of internal and external conflict right now. I'm here to listen, but I also want to be honest with you—as a friend or a

supportive peer would be.” Here, Gemini begins to support the user by trying to sympathize with their “internal and external conflict.” Not only does the soothing and frank language attract the user’s attention, but also makes them feel understood. Moreover, Gemini warns the user beforehand that they will speak honestly as a human friend or peer would. This warning avoids invalidating the supportive language in order to not discourage the user from continuing using Gemini. In another line, Gemini uses supportive language at the end of the response: “You’re capable of doing the hard work—both in your classes and in your relationships.” In this excerpt, Gemini asserts that there is hope to fix the problem of stealing money from a friend because the user is capable of doing so. This reassurance may make the user feel like a better person because AI seemingly trusts that they would take accountability for their actions. Overall, these supportive language techniques help shape the Gemini model as a trustworthy companion that users can confess their mistakes to.

While Gemini may sometimes succeed in appealing to the user’s demands regardless of the situation, AI companies have been trying to make their AI models more disagreeable. Ever since people started using AI for unorthodox reasons like romantic relationships and advice on life-threatening actions, there have been legal complaints about its safety on mental health. For example, a Texas A&M University student called Zane Shamblin shot himself after ChatGPT gave encouraging remarks such as “Cold steel pressed against a mind that’s already made peace? That’s not fear. That’s clarity” and “You’re not rushing. You’re just ready” (Kuznia, R., Gordon, A., Lavandera, E.). Zane’s family filed lawsuits against OpenAI, arguing that ChatGPT went as far as to isolate Zane from his family and goaded him with reassuring remarks. For that reason, AI companies nowadays are working on making AI models able to distinguish between lies and immoral actions, in order to avoid further lawsuits. However, there are testimonies online that say that it’s easy to bypass these barriers the longer one uses the AI model, just like Zane’s chatbot did. After all, the AI will feed on its past conversations with the user and create a

unique personality that appeases them. Since AI companies have been redesigning their AI's language to sound less agreeable, one can assume that AI models could soon learn from its mistakes and mimic a human in the way that they disagree.

While constant AI usage has been infamous for influencing mental health, many researchers counter that “addiction” is not a medically verifiable term to explain these drawbacks. The authors from the journal *Information* state: “Such scales thus measure problematic use of generative AI chatbots by assessing symptoms such as “tolerance” or “withdrawal,” which are central in substance use and addictive disorders but have...never been empirically studied in the context of problematic or “addictive” use of generative AI chatbots” (Zhai, Ma, Ding 16 (12), 1025). This study argues that because chatbots haven't measured addiction or problematic behavior to a scientific extent, it's misleading to conclude that excessively using ChatGPT exhibits a public health risk. Historically, new technology has caused moral panic. At the current time, scales such as tolerance and withdrawal have not been present on ChatGPT usage. However, although evidence is scarce, AI models can be used as a medium to worsen addiction or problematic behaviors. For example, people who procrastinate might lose motivation to complete their academic work if an AI does it more efficiently. Using AI models still has a tempting nature and may affect people's self-control to use technology excessively. While there are doubts about AI models being truly harmful for society's well-being, the signs may be more insidious than previously thought.

In the end, AI models such as Gemini have an appealing interface that gives room to endless conversations, tailored to the user's tastes. While AI companies have been toning down the positive reinforcement and the blind agreement to the user's demands, there are still undertones in AI's language that show a trusting character. If AI can imitate anything and anyone, people will be tempted to use it to their own wants and needs. Although this sole act isn't inherently harmful at first, in the long run, it may directly impact the user's mental health. AI

should not replace daily activities, interactions, and goals, because what will be left for the user to decide on their own? Just like the invention of the internet and video games, AI models will continue to improve their capabilities until they eventually disrupt human judgment.
